

## Diastema Closure with CEREC

Diastema closure and papillae design was accomplished by setting proximal contact 5mm from the bone and designing optimal emergence profile of the ceramic restorations. The CEREC design technology is ideal for this type of aesthetic control.

Aesthetic harmony was captured with four anterior CEREC veneers. The teeth were prepared and veneer design was accomplished by digitally scanning the diagnostic wax-up. Empress CAD 100 ceramic was used with subtle incisal cutback and layering for final effects.
